RE: Rain water catchment – Durapon 70®

To whom it may concern,

Dura Coat Products, Durapon 70® is a coil applied coating that contains 70% by weight polyvinylidene fluoride (PVDF) resin which is similar in composition to Teflon®. Additionally, acrylic resin, and high-performance pigments are used to provide the long-term durability and resistance to chalking and fading that Durapon 70® is known for.

During the application process, all volatile organic compounds (VOC's) are burned off. It is our belief that when properly applied and cured, the Durapon 70® paint system should not significantly leach or outgas harmful substances.

While we believe that metal panels coated with this paint system could be safe to use in a rainwater collection system we would always defer to the appropriate local, state, and federal agencies about what is acceptable.
